

Antibiotic Reduction

About the special

Producing healthy and safe animal products is key for a successful business. This can be accomplished by having the right management, feeding, welfare practices and disease control programmes in place. A healthy livestock production is increasingly linked to methods without the use of preventive antibiotics. Some systems even thrive with no antibiotics. But moving away from antibiotics can be challenging and requires a new way of thinking, adapting feeding practices and biosecurity plans for example.

In this special issue we take a look at lessons learned from countries which already adapted antibiotic reduction strategies. We tackle all the measures that can be taken to reduce or even move away completely from antibiotics use on a pig, poultry or cattle farm. We also touch on alternatives available on the market, nutritional strategies, breeding more robust animals, smart hygiene and housing strategies to keep pathogens out and much more.

Topics include

- Best practices to reduce antibiotics
- Biosecurity and management practices
- Nutritional strategies for healthy animals
- Boosting the natural immune system
- Improvement of gut health
- Food safety and consumer demands
